

A shoe that insulates supports for pipes such as water pipes and structures such as abutments

Insulation Shoe Type I: FLUOROGOLDM System

Insulation Shoe Type II: UNI-TON™ Bearing System

What is an insulation shoe?

Most water pipes require electrical corrosion prevention equipment, but aqueducts and their lower structures in particular may be electrically shorted through shoes. Pipe supports and structures such as abutments, therefore, must be electrically insulated without exception.

The insulation shoe is a shoe that provides electrical insulation using the shoe of a pipe support. It has a structure that supports the vertical load of the upper structure, allows movement caused by pipe elongation and contraction safely and smoothly, and provides electrical insulation*1 between the upper and lower shoes. We provide plate type FLUOROGOLD System "Insulation Shoe Type I," which absorbs movement, and UNI-TON Bearing System "Insulation Shoe Type II," which absorbs the angle of deflection. For this bearing system, we received guidance from the Design Committee at the Japan Water Steel Pipe Association.

Features of Insulation Shoe Type I

- This product is an economical, compact shoe that can support high loads.
- Sliding material with a low coefficient of friction*2 absorbs movement in the horizontal direction and reduces stress applied to structures such as bases. The sliding material has non-adhesiveness and self-lubricating capabilities, and requires no lubrication. Fine sand and dust on the surface are taken into the material as it slides, enabling the sliding characteristics to remain stable over a long period of time.
- The sliding material (PTFE containing filler) is chemically inert and has excellent weather resistance.
- Anchor bolt portions in contact with the shoes are coated with a PVDF lining with excellent insulating capability and strength.

*1: The electrical resistance between the upper and lower shoes is $10^6\Omega$ or more (when measured at a test voltage of 500 V and in dry indoor conditions).

*2: The sliding material employs polytetrafluoroethylene (PTFE) as the main component to enhance wear resistance and mechanical strength, containing filler with insulating capability.

Note: Insulation Shoe Type I cannot absorb inclinations in the vertical direction and is therefore used for small spans with a small angle of deflection.

Features of Insulation Shoe Type II

- This product is a compact shoe that can support high loads.
- Chloroprene rubber (elastomer) sealed in the lower shoe (base pot) absorbs the angle of deflection in the vertical direction, preventing the occurrence of an unbalanced load and stress concentration on the sliding surface. The deflection angle absorption capability is $\pm 1^\circ$ for the standard model ($\pm 2^\circ$ for special design).
- The upper shoe (sole plate) and ring support bottom plate are prevented from being lifted, by penetrating the insulation bolts embedded in the lower shoe (base pot) through the upper shoe and bottom plate to mount them.
- For movable type shoes, sliding material with a low coefficient of friction*2 absorbs movement in the horizontal direction. The sliding material smoothly moves across a wide range of surface pressure from low to high surface pressure and ensures stable operation even without lubrication. It does not cause stick-slip or generate sounds.
- The sliding materials (PTFE containing filler and SUS304 or SUS316) have excellent wear resistance and weather resistance.
- Elastomer completely binds the upper, lower, and side surfaces and does not change the height even if the load changes.
- The outer circumference of the metal (SS400) part is coated with heavy-duty anti-corrosion paint (L-2).
- This product can be installed by welding it onto steel construction or securing it on a concrete structure with anchor bolts.

Insulation Shoe Type I
For fixed/movable point

This product is a plate type shoe that provides electrical insulation and absorbs movement in the horizontal direction.

Structural drawing

Component list

Component number	Name	Material	Qty
1	FLUOROGOLD	SS400+PILAFLON	1
2	FLUOROGOLD	SS400+PILAFLON	1
3	Insulation anchor bolt	SS400+PVDF	1*1
4	Hexagon nut	SS400	1*1
5	Insulation washer	SS400+PILAFLON	1*1
6	Screw washer	SS400	1*1
7	Insulation sleeve	FRP	1*1
8	Protection cap	PVC	1*1

Note: SUS304 or SUS316 can also be used as the metal material.

*1: For 700A to 1500A, the quantity is 2.

- For the dimension of each part in the structural drawing, refer to the size table on page 3.
- When presenting the number of units or design conditions, note that shoes will be attached to both legs of the pipe support.
(The allowable vertical support load in the size table indicates a value per shoe.)
- The ring support bottom plates (upper and lower plates) indicated by dimension A in the structural drawing and size table are outside the scope of manufacturing. However, ring support bottom plates (upper and lower plates) must be manufactured according to the dimensions shown in the size table.

Applicable pipes: 700A to 1500A

Applicable pipe nominal size	Bottom plate section			Insulation anchor bolt					Insulation washer	Upper plate of bottom plates			Lower plate of bottom plates	Movable length	Upper and lower plates of bottom plates		FLUOROGOLD					P	T	Allowable vertical support load kN(tonf)

*2: For fixed type shoes, the hole on the upper plate is a round hole.

Insulation Shoe Type II For fixed point

This product is a fixed type shoe that provides electrical insulation and absorbs the angle of deflection in the vertical direction.

Structural drawings

The insulation shoe is shipped with the upper shoe (sole plate) and lower shoe (base pot) secured with temporarily securing brackets. After installation, remove the temporarily securing brackets.

Component list

Component number	Name	Material	Qty
1	Base pot	SS400	1
2	Sole plate	SS400	1
3	Piston	SUS304	1
4	Elastomer	Chloroprene rubber	1
5	Shim	PTFE	1
6	Seal ring	PTFE containing filler	1
7	Insulation bolt	SS400+PVDF	1
8	Insulation washer	PTFE containing filler+SS400	1
9	Conical spring washer	Steel	3
10	Hexagon nut (A)	SS400	2
11	Insulating plate	FRP (Epoxy glass)	1
12	Dust seal	Chloroprene rubber	1
13	Masonry plate	SS400	1
14	Anchor bolt	SD345	2
15	Hexagon nut (B)	SS400	4
16	Protection cap	PVC	1
17	Screw washer	SS400	1

Note: SUS304 or SUS316 can also be used as the metal material (except for conical spring washers).

Note, however, that anchor bolts are made of round bars.

- For the dimension of each part in the structural drawings, refer to the size table on page 5.
- When presenting the number of units or design conditions, note that shoes will be attached to both legs of the pipe support.
(The bearing capacity in the size table indicates a value per shoe.)
- The ring support bottom plate indicated by dimension t_1 in the structural drawing and size table is outside the scope of manufacturing. However, the ring support bottom plate must be manufactured according to the dimensions shown in the size table.
- This product cannot be attached to the ring support for 80A and 100A.

5

Insulation Shoe Type II For movable point

This product is a movable type shoe that provides electrical insulation, absorbs movement in the horizontal direction, and absorbs the angle of deflection in the vertical direction.

Structural drawings

Component list

Component number	Name	Material	Qty
1	Base pot	SS400	1
2	Sole plate	SS400	1

Notes 1) We design and manufacture products with non-standard dimensions separately.

2) For any dimension symbols not shown in the figures above, refer to the structural drawing on page 6.

*1: The vertical load indicates values measured at all times, and the horizontal load and uplift load indicate values measured in the event of earthquakes (short time period).

■ Characteristics of FLUOROGOLD / insulated bearing

Item	Characteristic value
Tensile strength (Minimum) MPa {kgf/cm ² }	13.7 {140}
Elongation (Minimum) %	200
Specific gravity	2.22
Hardness (Durometer D)	60 to 70
Coefficient of thermal expansion 1/°C	6.5×10 ⁻⁵

■ Coefficients of friction of sliding materials (FLUOROGOLD / insulated bearing)

Item	Relationship between surface pressure and coefficient of friction		
Surface pressure MPa {kgf/cm ² }	3.43 {35}	13.7 {140}	24.1 {246}
Coefficient of friction*1	0.12 or less	0.10 or less	0.08 or less

*1: This item shows coefficients of static and kinetic frictions when the sliding velocity is 0.042 cm/s or less and the mating surface is made of SUS304 2S or lower level stainless steel.

■ Characteristics of elastomer (chloroprene synthetic rubber)

Item	Testing method	Criteria
Static shear modulus of elasticity MPa {kgf/cm ² }	Section 6 of JIS K 6254 (Static shear modulus of elasticity)	0.8±0.1 {8±1.0}
Elongation at break (Minimum) %	JIS K 6251	400
Oil resistant test		
Volume change (Maximum) %	Section 8.1 of JIS K 6258 No. 3 oil: 100°C × 72 h	+120
Aging test		
Rate of change of tensile stress at 25% %	Section 3.3 of JIS K 6257 100°C × 72 h	-10 to +100
Rate of elongation change at break (Minimum) %	Section 3.3 of JIS K 6257 100°C × 72 h	-50 or more
Compression set %	JIS K 6262 100°C × 24 h	35 or less
Ozone resistance	Section 10 of JIS K 6259-1 50±5pphm, 20% elongation 40°C × 96 h	No cracks or significant changes

■ Installation precautions

Insulation shoes electrically insulate the lower and upper structures. When using insulation shoes, note that the lower and upper structures must not be energized.
